VR GAMBLING

2024-2025 PROJECT

Gambling - The act of wagering money or valuables on an event with an uncertain outcome, often involving chance or skill.

WHAT IF EVERY MOMENT HELD A WAGER?

Thank you for exploring **Snake Eyes**—a reimaging of gambling beyond the casino walls. Our game transforms the city into the playing field, where every moment is a bet, and awareness is your greatest advantage.

MEET THE TEAM

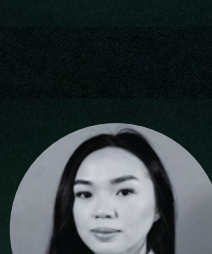

APAKHON RIAMCHAO
Game Design & Programming

I was at the head of development for Snake Eyes, and also assisted with creative direction.

LYNNA ZHANG
Creative Project Support

I contributed to the theme, 360° video shoot, and visual design—jumping in wherever needed. It was challenging but fun!

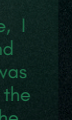

BENTEN BOYCHUK BONIFACE
Project Manager & Content Writer

Hello! Aside from being good company, I was in charge of breaking down tasks and keeping us on schedule. I also documented and compiled our process into this little booklet!

KATHRYN UY
Design & Branding

Hil! I joined this amazing group halfway through and took the design lead, building concepts, setting story guidelines, and testing the game to help shape the branding flow. I hope you enjoy reading our journey!

IVAN CHAN
Exhibition & Interactive Development

Yo, Unlike most people here, I learn more into practical and physical design. My focus was on creating the NFC chips, the poster frame, and filming the 560 video for our project.

WHAT IS snake eyes

Snake Eyes is a conceptual AR game prototype that imagines a future where gambling blends with everyday life. Instead of rolling dice, players place bets on real-world events—guessing outcomes of anything happening around them. If they guess right, they earn poker chips as in-game currency.

Place your bets on reality:

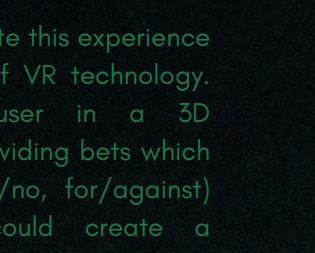

- Will the barista spill the drink?
- Which pigeon will fly away first?
- Will that car run the red light?

ANYTIME. ANYWHERE. YOU CAN BET ON IT.

INSPIRATIONS

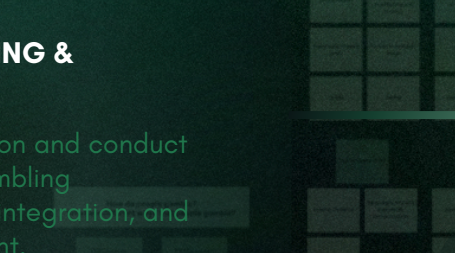

We decided to move forward with the idea of a future where bets could be placed on everything around you.

We hoped to critique the intersection of technology and exploitation by exploring how advanced gambling mechanics could exploit human behavior in a dystopian future.

SURVEILLANCE

Subtly integrate themes of modern surveillance. How might data collection and behavior tracking drive exploitation and addiction in gambling systems?

ADDICTION

Explore the addictive nature of gambling systems. How can we encourage users to reflect on their choices, especially when tied to real-life scenarios?

We felt we could simulate this experience by taking advantage of VR technology. By immersing the user in a 3D environment and by providing bets which were both binary (yes/no, for/against) and scripted, we could create a representation that would allow users to envision the technology while staying within time and budgetary constraints.

DESIGN PROCESS TIMELINE

BRAINSTORMING & RESEARCH

Gather inspiration and conduct research on gambling psychology, AR integration, and user engagement.

USER TASK FLOW DESIGN

Outline user tasks and interactions to ensure a smooth, intuitive experience for the player.

BRANDING & IDENTITY

Develop the visual identity, including logo, color schemes, and design elements that match the game's tone and theme.

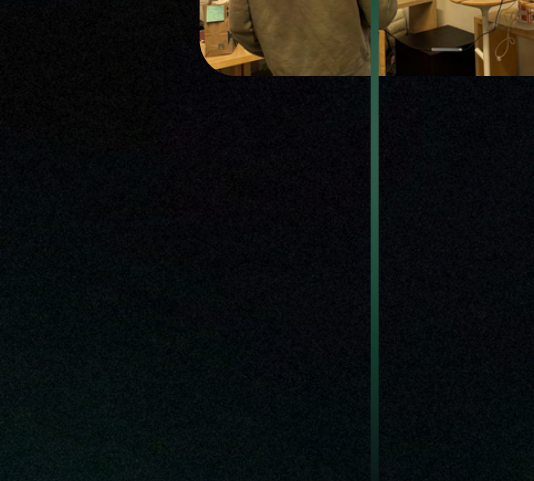

DEVELOPMENT

Build the AR mechanics, integrate gameplay features, and establish the system for betting, rewards, and outcomes.

TESTING & SURVEYS

Conduct gameplay testing with users, gather feedback, and run surveys to assess user experience and emotional impact.

EXHIBITION DESIGN & BUILD

Design the exhibition space and build out the environment for showcasing the game, ensuring it reflects the immersive nature of Snake Eyes.

YES
!25

YEAR-END SHOW

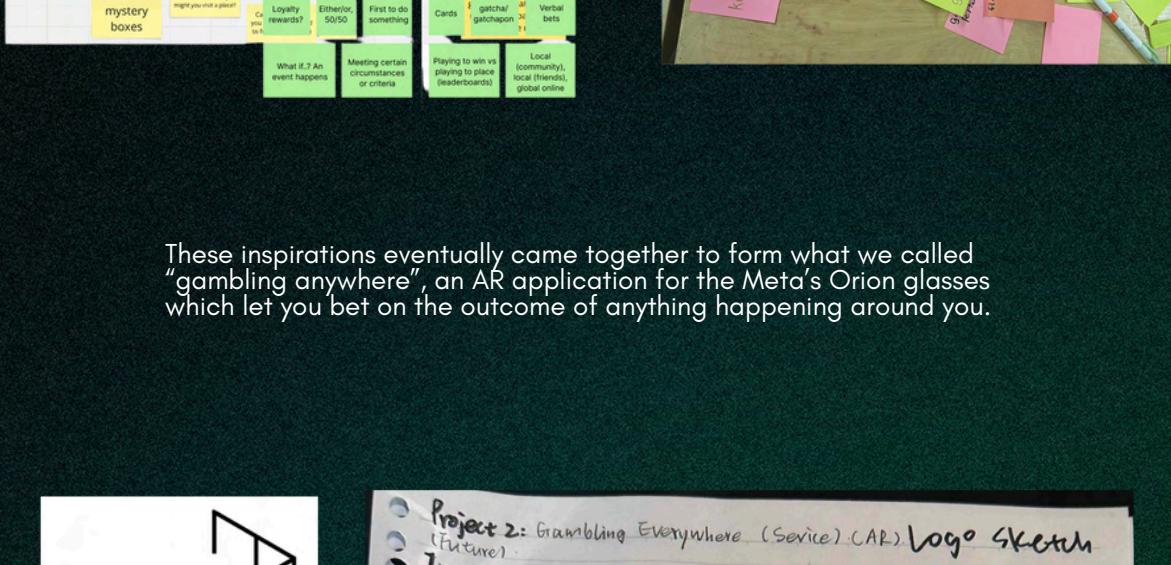

Present the final game concept, mechanics, and exhibition design at the year-end show!

TAKE A CHANCE AND SEE WHAT HAPPENS

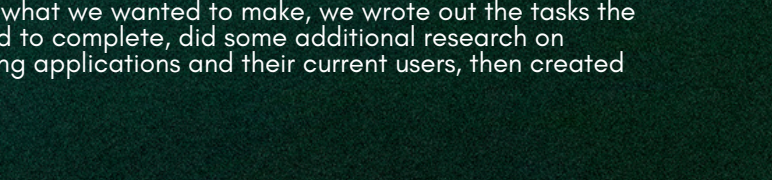

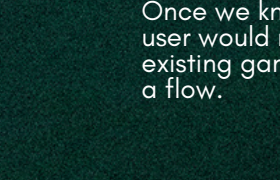

PROCESS BOOK

BRAINSTORMING

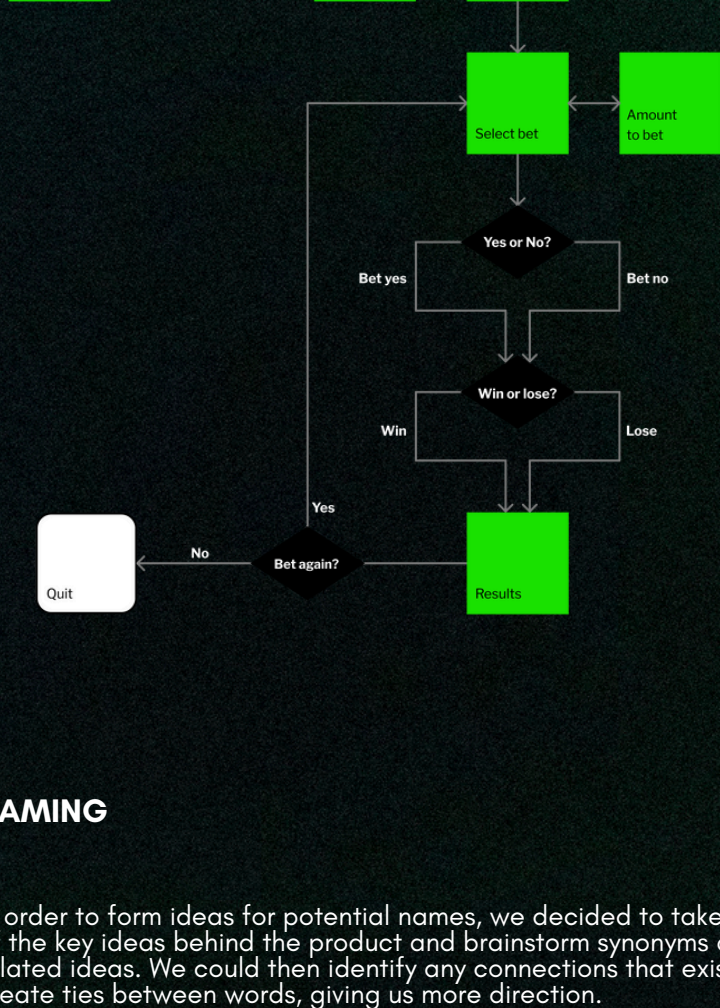

Our first and most important task was to figure out exactly what we were doing. We started by brainstorming on the idea of entertainment and the shape that it took for different groups of people. We then returned to gambling and considered it in its different forms. These items later served as the inspiration for our game.

These inspirations eventually came together to form what we called "gambling anywhere", an AR application for the Meta's Orion glasses which let you bet on the outcome of anything happening around you.

Once we knew what we wanted to make, we wrote out the tasks the user would need to complete, did some additional research on existing gambling applications and their current users, then created a flow.

NAMING

In order to form ideas for potential names, we decided to take some of the key ideas behind the product and brainstorm synonyms and related ideas. We could then identify any connections that existed or create ties between words, giving us more direction.

Sight, seeing, glasses

See, lens, spectacles, vision, eye

Gambling, casinos

Chance, fortune, bet, luck, blind

Portability, ease of access

Everywhere, pocket, virtual, anywhere

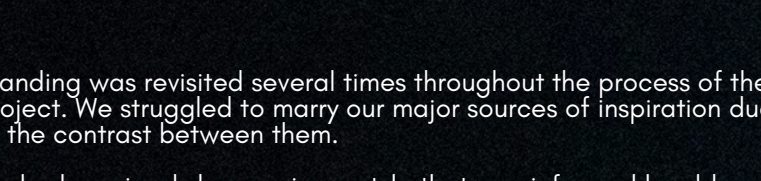

AnyChance	Vegas Vision	PortaBet
ChipSee	Lens Vegas	VirtualAce
Coinvenient	Snake Eyes	Spectabet
BlindVision	HighRoller	Casinout

LOGO

After choosing to move forward with the name "Snake Eyes", brainstorming for the logo began. Initial sketches focused on including the glasses, since they were central to our idea.

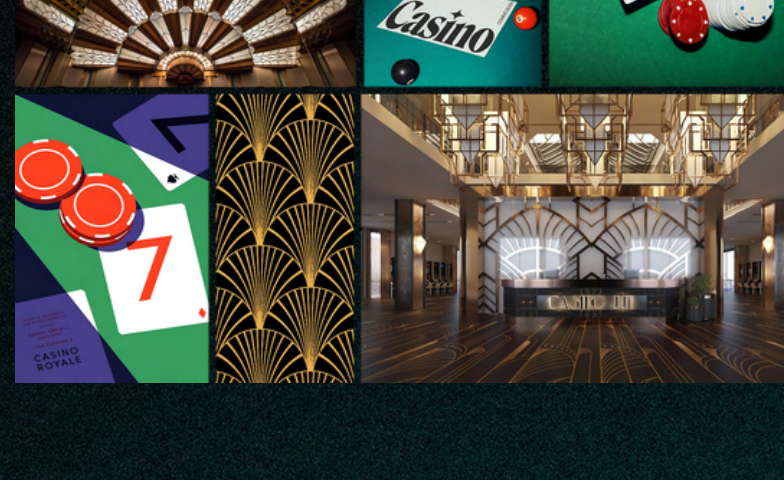

This later evolved into a stylized snake taking the place of one of the dice in a snake eye. The snake's eye took the place of a one with the hope that the idea of looking or watching was still captured.

BRANDING

Branding was revisited several times throughout the process of the project. We struggled to marry our major sources of inspiration due to the contrast between them.

We had previously been using a style that was informed by old casinos and art deco, but for a more futuristic concept, like the one we were planning, we considered more sleek and modern designs. The two styles felt like opposites and we found ourselves struggling to reconcile them.

We decided to lean into a more futuristic style, while finding ways to draw inspiration from old casinos and speakeasies wherever we could.

We primarily made use of black and white for their boldness and clarity, which was especially useful in a VR setting, but included touches of green, a colour reminiscent of both money and code.

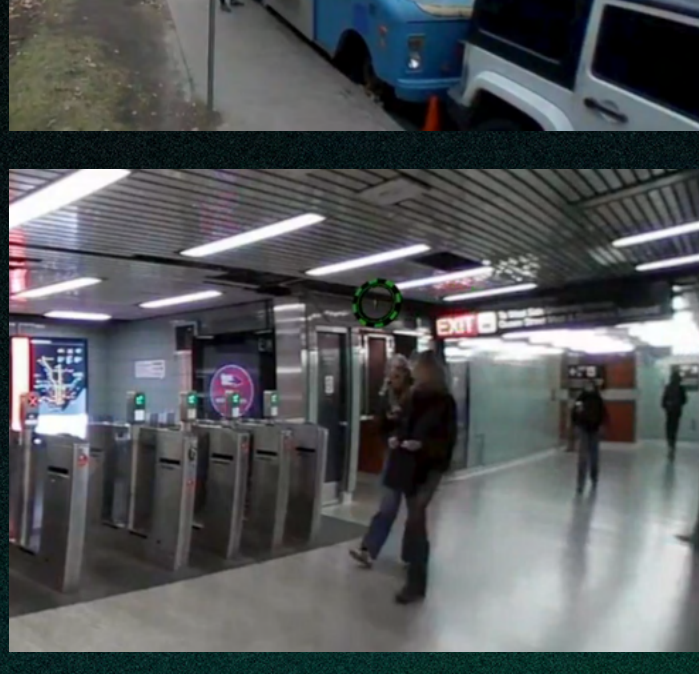

DEVELOPMENT

There were many features which were eventually scrapped in order to achieve a working final product. Although these explorations did not fully achieve the desired outcomes, they provided valuable technical directions and insights for future design development.

BET POINTS

"Bet points", illustrated below, represented events which players were able to bet on. They were imagined to move with people, disappearing and appearing as events ended and began, creating the moment-to-moment betting experience.

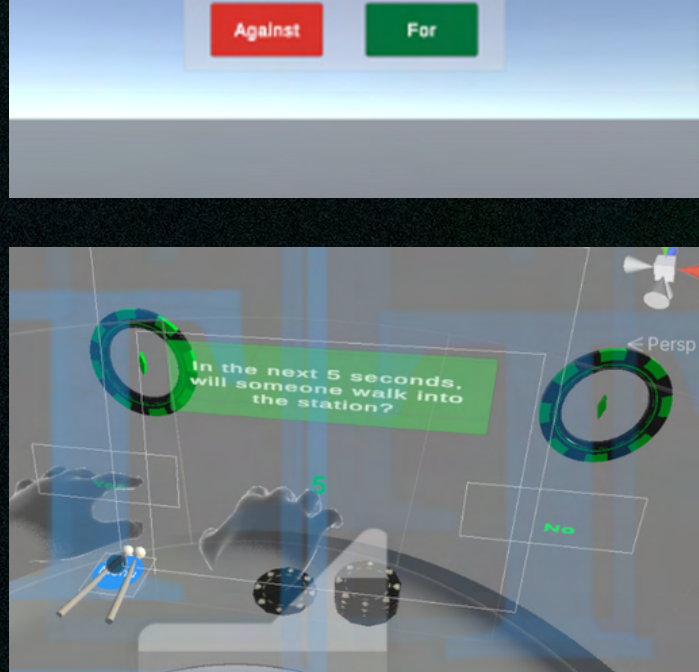

Unfortunately, several difficulties were encountered in the process of training and integrating the AI, so key features like moving "bet points" and situation based questions needed to be scrapped for the sake of completion.

ENGAGEMENT AND PARTICIPATION

Our initial vision imagined the betting to be sneaky. After all, people would likely be uncomfortable with the idea of being the subject of a bet. While in the real world, this might make sense, in the context of a demo, it felt underwhelming and unengaging. Our focus led us to overlook the experiential aspect of user interaction. We were not fully leveraging the potential of the technology we were utilizing.

We decided to maximize the use of 3D space by redesigning the way that users would bet. We wanted to mimic the physical action of pushing poker chips to go "all-in", transforming the interaction into a more immersive and meaningful style of engagement. This action later evolved into throwing for the sake of simplicity, but this shift was what gave us the inspiration to create the dealers table and playing cards for menus.

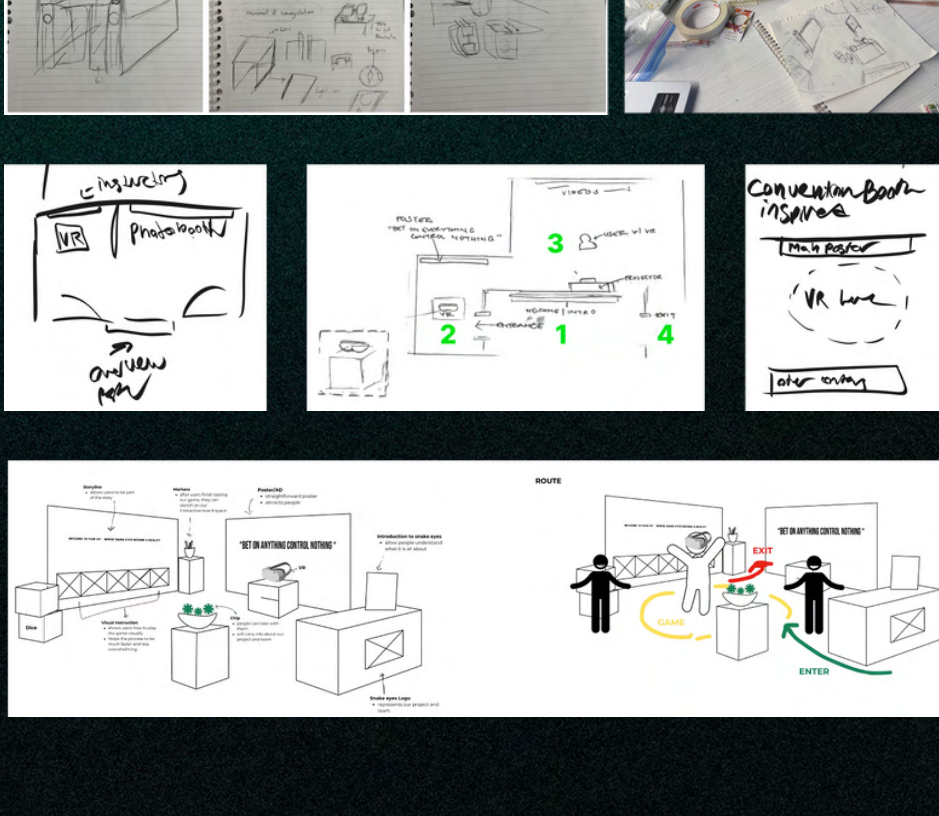

Halfway through the year, we presented our prototype alongside a survey to assess how people responded to the experience. The feedback received provided us valuable guidance and gave us direction in how to best refine the experience.

EXHIBITION DESIGN

We began designing the exhibition layout before we knew what space we were given. We decided to operate under the assumption that we would have minimal space, and felt it was important to clearly delineate a space so guests could safely engage with a VR environment. Most of our initial designs prioritized creating this space.

The more we experimented, the more clarity we gained about what kind of layout we wanted.

When we were later told we would have the centre space, we adapted our designs and worked to decide on the specifics.

When choosing a layout for the exhibition, we originally were planning to emulate the atmosphere of a ritzy casino. Items like red carpets and velvet stanchions would give a feeling of exclusivity. When we considered the main themes of the project, we felt it would be better to pivot and focus more on the idea of surveillance and day-to-day life. After our plan was finalized, the rest progressed quickly and smoothly.

THANK YOU FOR YOUR INTEREST IN OUR PROJECT!
